

CRNG, Kadjebi

Green Roots: Restoring Nature in Kadjebi

Background

In Kadjebi, in Ghana's Oti Region, communities are feeling the effects of soil erosion and a changing climate. Community Resilience Network Ghana (CRNG) works to strengthen local resilience through practical environmental action, and saw tree planting as a simple, visible way to bring people together to care for their land.

Solutions

A Global Landcare Small Grant of AUD \$500 funded a community tree planting day in 2025. CRNG bought 50 tree seedlings, along with shovels, pick axes and water cans, and hired transport to get everything to the site. Community volunteers, supported by four local helpers, planted all 50 trees as planned.

Preparing the Ground

The soil at the planting site is hard going, so four pick axes and four shovels were bought to dig holes deep enough for the young trees to root properly. The tools now stay with the community for future projects.

Planting Together

Volunteers and community members turned out to plant, showing real ownership of the project. Light refreshments thanked them for their time, and four local helpers received a small token for their work.

Caring for Young Trees

Two water cans were bought so the seedlings can be watered through the critical first weeks after planting, giving each tree the best chance to survive and grow.

Moving Forward

All 50 trees are in the ground, and the new tools will keep serving CRNG's future projects. As the trees grow they will help hold the soil, reduce erosion and support climate adaptation in Kadjebi. CRNG thanks Global Landcare for its support and looks forward to more partnerships that build lasting resilience.
